

CH14.1 矩陣的運算

$$1.5 \quad 2.123. \begin{bmatrix} 1 & 1 \\ 3 & 2 \end{bmatrix} \quad 4.5 \quad 5. (A)(D)(E) \quad 6. (-1, -5)$$

$$7. \left(1, \frac{15}{2}\right) \quad 8. \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad 9. (5, -8, 3) \quad 10. \frac{5}{2}$$

解析

$$1. \text{ 解 } \begin{cases} 6a - b = -19 \\ a - 2b = -16 \end{cases} \text{ 得 } \begin{cases} a = -2 \\ b = 7 \end{cases}$$

$$\therefore a + b = \underline{5}$$

$$2. A = [a_{ij}]_{2 \times 3} = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \end{bmatrix} = \begin{bmatrix} 2 & 1 & 1 \\ 2 & 4 & 2 \end{bmatrix}$$

$$\text{所有元素總和為 } 2 + 1 + 1 + 2 + 4 + 2 = \underline{12}$$

$$3. X + Y = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} \cdots \text{①}, X - 2Y = \begin{bmatrix} 1 & -1 \\ 3 & -2 \end{bmatrix} \cdots \text{②}$$

$$\text{①} \times 2 + \text{②} \text{ 得 } 3X = 2 \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix} + \begin{bmatrix} 1 & -1 \\ 3 & -2 \end{bmatrix} = \begin{bmatrix} 3 & 3 \\ 9 & 6 \end{bmatrix}$$

$$\Leftrightarrow X = \frac{1}{3} \begin{bmatrix} 3 & 3 \\ 9 & 6 \end{bmatrix} = \begin{bmatrix} 1 & 1 \\ 3 & 2 \end{bmatrix}$$

$$4. \text{ 由 } (A + B)^2 = A^2 + 2AB + B^2 \text{ 可推得 } AB = BA$$

$$\text{即 } \begin{bmatrix} 1 & 2 \\ 1 & 3 \end{bmatrix} \begin{bmatrix} 3 & 2 \\ 1 & k \end{bmatrix} = \begin{bmatrix} 3 & 2 \\ 1 & k \end{bmatrix} \begin{bmatrix} 1 & 2 \\ 1 & 3 \end{bmatrix}$$

$$\Rightarrow \begin{bmatrix} 5 & 2 + 2k \\ 6 & 2 + 3k \end{bmatrix} = \begin{bmatrix} 5 & 12 \\ 1 + k & 2 + 3k \end{bmatrix} \Rightarrow k = \underline{5}$$

$$5. (A) \quad \bigcirc : \because AI = IA \Rightarrow A^3 - I = (A - I)(A^2 + A + I)$$

$$(B) \quad \times : AB \text{ 不一定等於 } BA$$

$$(C) \quad \times : \text{反例: 設 } A = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix} \neq O, A^2 = O$$

$$(D) \quad \because \text{若 } AB = I, \text{ 則 } B = A^{-1} \therefore BA = A^{-1}A = I = AB$$

$$(E) \quad \bigcirc : (A + 2I)(A - 2I) = A^2 - 2AI + 2IA - 4I^2 = A^2 - 4I$$

故選(A)(D)

$$6. A^2 = \begin{bmatrix} -2 & -1 \\ 1 & 3 \end{bmatrix} \begin{bmatrix} -2 & -1 \\ 1 & 3 \end{bmatrix} = \begin{bmatrix} 3 & -1 \\ 1 & 8 \end{bmatrix}$$

$$A^2 + aA + bI_2 = O_2 \Rightarrow \begin{bmatrix} 3 & -1 \\ 1 & 8 \end{bmatrix} + \begin{bmatrix} -2a & -a \\ a & 3a \end{bmatrix} + \begin{bmatrix} b & 0 \\ 0 & b \end{bmatrix}$$

$$= \begin{bmatrix} 3-2a+b & -1-a \\ 1+a & 8+3a+b \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} = O_2$$

$$\Rightarrow 1+a=0, 3-2a+b=0, 8+3a+b=0$$

$$\therefore a = -1, b = -5$$

即數對 $(a, b) = \underline{(-1, -5)}$

$$7. A^2 = \begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 2 & 2 \\ 2 & 2 \end{bmatrix} = 2A$$

$$A^3 = A^2 \cdot A = 2A \cdot A = 2A^2 = 4A = 2^2A, \dots$$

$$\therefore A^n = 2^{n-1}A$$

$$\begin{aligned} \Rightarrow \left(I + \frac{1}{2}A\right)^4 &= I + C_1^4 \left(\frac{1}{2}A\right) + C_2^4 \left(\frac{1}{2}A\right)^2 + C_3^4 \left(\frac{1}{2}A\right)^3 + C_4^4 \left(\frac{1}{2}A\right)^4 \\ &= I + C_1^4 \left(\frac{1}{2}A\right) + C_2^4 \left(\frac{1}{2^2} \cdot 2A\right) + C_3^4 \left(\frac{1}{2^3} \cdot 2^2A\right) + C_4^4 \left(\frac{1}{2^4} \cdot 2^3A\right) \\ &= I + \frac{1}{2}(C_1^4 + C_2^4 + C_3^4 + C_4^4)A = I + \frac{15}{2}A \end{aligned}$$

$$\therefore \text{數對 } (a, b) = \left(1, \frac{15}{2}\right)$$

$$8. \text{ 可得 } A^2 = \begin{bmatrix} 11 & -\overline{30} \\ 4 & -11 \end{bmatrix} \begin{bmatrix} 11 & -30 \\ 4 & -11 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = I$$

$$\Rightarrow A^6 = (A^2)^3 = I^3 = I = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$$9. \begin{bmatrix} 1 & 1 & -2 & 1 \\ 2 & 3 & -6 & a \\ 3 & 4 & b & 6 \end{bmatrix} \leftarrow (-3)$$

$$\Rightarrow \left[\begin{array}{ccc|c} 1 & 1 & -2 & 1 \\ 0 & 1 & -2 & a-2 \\ 0 & 1 & b+6 & 3 \end{array} \right] \times (-1) \Rightarrow \left[\begin{array}{ccc|c} 1 & 0 & 0 & 3-a \\ 0 & 1 & -2 & a-2 \\ 0 & 0 & b+8 & 5-a \end{array} \right]$$

$$\therefore 3-a = -2, a-2 = c, b+8 = 0, 5-a = 0$$

得 $a = 5, b = -8, c = 3$

故序組 $(a, b, c) = (5, -8, 3)$

$$10. \left[\begin{array}{cccc} 1 & -1 & 2 & 2-a \\ 1 & 3 & -3 & 1+a \\ 3 & 1 & 1 & a \end{array} \right] \times (-3)$$

$$\Rightarrow \left[\begin{array}{ccc|c} 1 & -1 & 2 & 2-a \\ 0 & 4 & -5 & 2a-1 \\ 0 & 4 & -5 & a-6 \end{array} \right] \times (-1)$$

$$\Rightarrow \left[\begin{array}{ccc|c} 1 & -1 & 2 & 2-a \\ 0 & 4 & -5 & 2a-1 \\ 0 & 0 & 0 & 2a-5 \end{array} \right] \text{ 有解}$$

$$\Rightarrow 2a-5 = 0 \Rightarrow a = \underline{\underline{\frac{5}{2}}}$$
