

CH2.2 直線與圓

$$1. \sqrt{7} \quad 2. (B) \quad 3. -\frac{\sqrt{10}}{2} < k < \frac{\sqrt{10}}{2} \quad 4. (A)(B)(C)(E)$$

$$5. (x-5)^2 + (y-3)^2 = 16 \quad \text{或} \quad (x-1)^2 + (y+1)^2 = 16$$

$$6. x^2 + y^2 - 4x + 12y + 15 = 0 \quad 7. (4, -1)$$

$$8. (1,1) \quad \text{或} \quad \left(-\frac{1}{5}, -\frac{7}{5}\right)$$

$$9. x - 3y + 2 = 0 \quad \text{或} \quad 3x + y - 14 = 0$$

$$10. (1) 4 \quad (2) 2\sqrt{5} \quad (3) y = -1 \quad \text{或} \quad 24x + 7y - 113 = 0$$

解析

$$1. x^2 + y^2 - 6x - 2y = 0 \Rightarrow (x-3)^2 + (y-1)^2 = 10$$

$$\text{圓心 } O(3,1), r = \sqrt{10}$$

$$\text{點到圓心距離} = \sqrt{4^2 + 1^2} = \sqrt{17}$$

$$\text{切線段長} = \sqrt{17 - 10} = \sqrt{7}$$

$$2. \text{已知 } L: 3x - 4y = 8, \text{ 圓: } x^2 + y^2 - 2x + ay + b = 0$$

$$\Leftrightarrow (x-1)^2 + \left(y + \frac{a}{2}\right)^2 = 1 + \frac{a^2}{4} - b \Leftrightarrow \text{圓心 } O\left(1, -\frac{a}{2}\right)$$

$$\text{切點 } P(4,1), m_L = \frac{3}{4}, \text{ 又 } \overline{OP} \perp L$$

$$\therefore m_{\overline{OP}} = -\frac{4}{3}$$

$$\Rightarrow \frac{1 - \left(-\frac{a}{2}\right)}{4 - 1} = -\frac{4}{3} \Rightarrow 1 + \frac{a}{2} = -4 \Rightarrow \frac{a}{2} = -5 \Rightarrow a = -10$$

$$\text{將 } (4,1) \text{ 代入圓 } \Leftrightarrow 16 + 1 - 8 - 10 + b = 0 \Leftrightarrow b = 1$$

故選(B)

$$3. (k+1, k-2) \text{ 在圓 } C \text{ 內部: } x^2 + y^2 - 4x + 6y + 6 < 0 \Rightarrow (k+1)^2 + (k-2)^2 - 4(k+1) + 6(k-2) + 6 < 0 \Rightarrow 2k^2 - 5 < 0$$

得 $-\frac{\sqrt{10}}{2} < k < \frac{\sqrt{10}}{2}$

4. $C: (x+2)^2 + (y-1)^2 = 9$, 圓心 $O(-2,1)$, 半徑 $r = 3$

(A) $\square: \overline{OP} = \sqrt{3^2 + 4^2} = 5$, 最小距離 $\overline{OP} - r = 5 - 3 = 2$

(B) $\because$ 切線段長 $= \sqrt{\overline{OP}^2 - r^2} = \sqrt{25 - 9} = 4$

(C) $\circ: d(O, L) = \frac{|-6+4-18|}{\sqrt{3^2+4^2}} = \frac{20}{5} = 4 > r \Rightarrow L$ 與 C 不相交

(D) X : 承(C)

(E) $\circ$: 所求為 $d + r = 4 + 3 = 7$

故選(A)(B)(C)(E)

5. $\because$ 圓心在 $x - y - 2 = 0$ 上

$\therefore$ 令圓心 $(t+2, t), t \in R$

$$\Rightarrow \text{半徑長為} \sqrt{(t+2-1)^2 + (t-3)^2}$$

$$\Rightarrow 4 = \sqrt{(t+1)^2 + (t-3)^2} \Rightarrow 16 = 2t^2 - 4t + 10$$

$$\Rightarrow t^2 - 2t - 3 = 0 \Rightarrow t = 3 \text{ 或 } -1$$

(1)若 $t = 3$, 則圓心(5,3)

圓方程式 $(x-5)^2 + (y-3)^2 = 16$

(2)若 $t = -1$, 則圓心(1, -1)

圓方程式 $(x-1)^2 + (y+1)^2 = 16$

6. 令圓方程式 $x^2 + y^2 + dx + ey + f = 0$

過 $(2, -1), (6, -3), (-1, -10)$ 三點

$$\begin{cases} 4 + 1 + 2d - e + f = 0 \\ 36 + 9 + 6d - 3e + f = 0 \\ 1 + 100 - d - 10e + f = 0 \end{cases} \Rightarrow \begin{cases} d = -4 \\ e = 12 \\ f = 15 \end{cases}$$

$$\Rightarrow \text{所求圓方程式為 } x^2 + y^2 - 4x + 12y + 15 = 0$$

$$7. C: (x-1)^2 + (y+2)^2 = 10$$

$\Rightarrow$ 圓心 $O(1, -2)$,

$$r = \sqrt{10}, P(10, 1)$$

$$\overline{OP} = \sqrt{9^2 + 3^2} = \sqrt{90} = 3\sqrt{10}$$

$$\therefore \overline{OQ} : \overline{QP} = r : (\overline{OP} - r) = \sqrt{10} : 2\sqrt{10} = 1 : 2$$

由內分點公式可知 $Q\left(\frac{1 \times 10 + 2 \times 1}{1+2}, \frac{1 \times 1 + 2 \times (-2)}{1+2}\right)$

$$= (4, -1)$$

8. $\because 4^2 + (-2)^2 = 20 > 2 \therefore$ 點 $P(4, -2)$ 在圓外

設切點是 $Q(a, b)$, 則切線為 $ax + by = 2$

過點 $P(4, -2) \Leftrightarrow 4a - 2b = 2 \Rightarrow b = 2a - 1 \dots\dots \textcircled{1}$

又 $Q(a, b)$ 在圓上, 因此 $a^2 + b^2 = 2 \dots\dots \textcircled{2}$

將 $\textcircled{1}$ 代入 $\textcircled{2}$ 得 $a^2 + (2a - 1)^2 = 2 \Rightarrow 5a^2 - 4a - 1 = 0$

$\Rightarrow a = 1$ 或 $-\frac{1}{5} \Rightarrow a = 1$ 時, 切點為 $(1, 1)$

$a = -\frac{1}{5}$ 時, 切點為 $\left(-\frac{1}{5}, -\frac{7}{5}\right)$

$$9. x^2 + y^2 - 4x + 4y - 2 = 0 \Rightarrow (x-2)^2 + (y+2)^2 = 10$$

$\therefore$ 圓心為 $(2, -2)$, 半徑為 $\sqrt{10}$

$$\text{圓心與切線 } L \text{ 的距離} = \frac{|2m - (-2) + 2 - 4m|}{\sqrt{m^2 + (-1)^2}} = \sqrt{10}$$

$$\Leftrightarrow |-2m + 4| = \sqrt{10} \times \sqrt{m^2 + 1} \Leftrightarrow m = -3 \text{ 或 } \frac{1}{3}$$

故切線方程式為 $x - 3y + 2 = 0$ 或 $3x + y - 14 = 0$

$$10. C: x^2 + y^2 - 2x - 4y - 4 = 0 \Rightarrow (x-1)^2 + (y-2)^2 = 9$$

圓心 $O(1,2)$, 半徑 $r = 3$

$$(1) \overline{OA} = \sqrt{4^2 + (-3)^2} = 5$$

$$\therefore \text{切線長} = \sqrt{\overline{OA}^2 - r^2} = \sqrt{5^2 - 3^2} = \underline{4}$$

$$(2) d(O, L) = \frac{|4+6|}{\sqrt{4^2+3^2}} = \frac{10}{5} = 2$$

$$\therefore \overline{PQ} = 2\sqrt{r^2 - (d(O, L))^2} = 2\sqrt{3^2 - 2^2} = \underline{2\sqrt{5}}$$

(3) 設過 $A(5, -1)$ 的切線方程式 $(y+1) = m(x-5)$

$$\Rightarrow mx - y + (-5m - 1) = 0$$

$$\text{則 } d(O, L) = r \Rightarrow \frac{|m-2-5m-1|}{\sqrt{m^2+(-1)^2}} = 3$$

$$\Rightarrow |-4m-3| = \sqrt{9m^2+9} \Rightarrow 16m^2+24m+9 = 9m^2+9$$

$$\Rightarrow 7m^2+24m=0 \Rightarrow m(7m+24)=0$$

$$\therefore m = 0 \text{ 或 } -\frac{24}{7}$$

① 若 $m = 0$, 則 $(y+1) = 0 \Rightarrow y = -1$

② 若 $m = -\frac{24}{7}$, 則 $(y+1) = -\frac{24}{7}(x-5)$

$$\Rightarrow 24x + 7y - 113 = 0$$

故切線方程式為 $y = -1$ 或 $24x + 7y - 113 = 0$
